

①

$$A = 2B$$

$$B = 3C$$

$$C \rightarrow \underline{90 \text{ min.}}$$

$$A \xrightarrow{\quad} 2B \xrightarrow{\quad} 3C$$

~~$$A = 3C$$~~

$$\underline{A = 6C}$$

time  $\rightarrow$

$$A = \frac{90}{6} = \underline{15 \text{ min.}}$$

$$\boxed{\underline{\text{Answer} = 15 \text{ min}}}$$

②

$$S = 300 \text{ m/sec} = 0.3 \text{ km/sec}$$

$$\therefore 1 \text{ sec. distance covered} = \underline{0.3 \text{ km.}}$$

$$\therefore 10 \text{ sec} \quad \quad \quad = 0.3 \text{ km} \times 10$$

$$= \underline{3 \text{ km.}}$$

$$\boxed{\underline{\text{Answer} = 3 \text{ km}}}$$

③

$$\underline{\text{let}} \rightarrow \text{the distance} \rightarrow \underline{1200 \text{ km.}}$$

$$\frac{1}{3} \text{ part} = \frac{1}{3}(1200) = 400 \text{ km.}$$

$$\frac{1}{4} \text{ part} = \frac{1}{4}(1200) = 300 \text{ km}$$

$$\text{Remaining} \rightarrow \underline{500 \text{ km.}}$$

Total distance = 1200 km

Time Covered by the distance, ( $T$ )

$$t = \frac{d}{s}$$

$$T = \frac{400}{25} + \frac{300}{30} + \frac{500}{50}$$

$$T = 36 \text{ hr}$$

$$\text{Average speed} = \frac{\text{Total distance}}{\text{Total Time}}$$

$$= \frac{1200}{36} = \frac{100}{3} \text{ km/hr}$$

$$x = 33\frac{1}{3} \text{ km/hr} \quad \text{Ans}$$

let the original speed =  $3x \text{ km/hr}$

if train met at point A,

$$\frac{120}{3x} + \frac{d-120}{2x} = \left(t + \frac{3}{2}\right) \quad \text{--- (1)}$$

if train met point B  $\rightarrow$

$$\frac{180}{3x} + \frac{d-180}{2x} = (t+1) \quad \text{--- (2)}$$

Eq<sup>n</sup> (1) - Eq<sup>n</sup> (2)

$$\frac{d-120-d+180}{2 \cdot 2x} + \frac{120-180}{3x} = \frac{1}{2}$$

$$\frac{60}{2x} - \frac{60}{3x} = \frac{1}{2}$$

$$\frac{180 - 120}{6x} = \frac{1}{2}$$

$$\frac{60}{6x} = \frac{1}{2}$$

$$\frac{10}{x} = \frac{1}{2}$$

$$x = 20$$

So original speed  $\Rightarrow 3x \Rightarrow \boxed{60 \text{ km/hr}}$  A<sub>3</sub>

(5)

Relative speed  $\Rightarrow 9 - 5 = 4 \text{ km/hr}$

$$= 4 \left( \frac{5}{18} \right) \Rightarrow \frac{10}{9} \text{ m/sec}$$

Time taken in overtaking the thief  $\Rightarrow$

$$d = 400 \text{ m}$$

$$p = \frac{10}{9} \text{ m/s}$$

$$T = \frac{400 \times 9}{10} \Rightarrow \underline{360 \text{ sec}}$$

Distance Covered by thief  $\Rightarrow$

$$D = \text{Speed} \times \text{time}$$

$$D = \frac{5 \times 5}{18} \times 360 = \underline{500 \text{ meter}}$$

$$D = 500 \text{ meter} = 0.5 \text{ km}$$

Ans
